SUMMARY

Hi, my name is Chukwuebuka Stanley. A recent grad of Mathematics 2022 and a full-stack developer. In 2020, went into programming out of passion; in 2021, even though school resumed and I had to focus more on my studies, I built an ID-card generating website for my IT project that earned me an A+ grade; in 2022, I wrote my last paper and I got and completed a couple of freelancing jobs. This year I hope to get a tech position where I can carry out my NYSC service and retained. For me tech is life--even though I might not be halfway near where I want to be right now, I am grateful for every day that I get to practice it.

EDUCATION

2017-2022	Bachelor of Science in Mathematics. Nnamdi Azikiwe University
2020	Modern JavaScript. By Shaun pelling (thenetninja)
2020-2021	The complete 2020 development camp (Dr Angela Yu)
2012-2022	Senior Secondary Certificate. Tai Solarin Memorial secondary school

PROJECTS & EXPERIENCE

ID GENERATOR WEB APP (UNIZIK-ID.HEROKUAPP.COM)

More than half the students didn't have an ID card since they took too long to be ready, so I came up with a site that handled it in seconds. I constructed this for my IT project because I wanted to use tech to enhance a part of the school. Although the most of the work was done on the front end, I still had a database to store user information that is used to distinguish between authentic and counterfeit and a route to do just that. The card has a QR code printed on the back that is encrypted with the user information using javascript, making it possible to use it as a key card to enter classrooms, take examinations, or even record attendance.

THESEVENAPEX.COM

I built a freelance website during my time freelancing. It was during this time that I got jobs to build web applications like crypto trading websites and portfolio websites. The feeling of building something that someone else would use was unbeatable. Freelancing pushed me out of my comfort zone and made me try new tools, like media storage and passport authentication. It made me a better developer.

REAL ESTATE LISTING WEB APPLICATION

This is the first application I'm developing that requires a lot of media storage. I decided to do it using Google Cloud Storage. To secure the routes that administrators and agents use to upload new listings, I employed authentication. Express was used for routing, and the database I used was NOSQL (MONGODB).

All my projects can be seen on **https://www.github.com/stainlezzking**
